Lexumo Lands \$4.89 Million Seed Round To Help Ensure Open Source Code Security

Lexumo, a Cambridge, Massachusetts cloud service that continuously checks open source code to be sure it has the latest security updates, announced a solid \$4.89 million seed round today. The round was led by Accomplice, .406 Ventures and Draper.

What has Lexumo created to warrant that kind of financial attention? It indexed all of the open source code in the world and created a cloud security service aimed at helping companies using open source code inside embedded systems or enterprise software. These groups can submit their code to the Lexumo service and it checks for any known security vulnerabilities. What's more, it will then continuously monitor the code for updates and inform developers when one is available.

The service provides an automated way to keep the code secure, a process that has been difficult if not impossible for companies using open source code in their software to track themselves, Brad Gaynor, CEO at Lexumo told TechCrunch.

The company recognized that developers were using open source libraries to quickly build and distribute software, but lacked the personnel to track updates (or understand how it would affect the existing code to implement those updates).
